SKC expand product offerings of PVDF films. (Mar-25-2014)

PVDF, well known fluorine polymer, has higher resistance to none-polar solvents, dirt, acid rain.

SKC PVDF films are extruded films with single or two layers. The two-layer films consist of PVDF and acrylic polymer and the acrylic layer provides better productivity in lamination process. Also, a grade with UV absorbents hinders from discoloration of under-layers.

SKC supplies white, clear, black, and grey of PVDF films and they can be applied to Photovoltaic backsheets, wallpapers, billboards, synthetic leathers, steel sheets and so on.
