SKC developed polyester based iridescent films (Fancylite).

Fancylite is a polyester based iridescent film. Like regular polyester films, Fancylite is made in both direction stretching, so it has an excellent processability in various converting processes. It can be embossed or laminated to different colored background to further enhance visual effects. Also, due to robust mechanical properties, Fancylite can be used for higher strength applications such as slitted yarn and stand-alone candy wrapping. TO64C is one side corona treated for better adhesion in lamination and printing.

If you need a product brochure of Fancylite, please contact us thru this website.
